

Passion and **dedication** build bridges
between dreams and reality.

Imecon

IMECON

IMECON Engineering S.r.l. is a leading Italian company that specialises in the design, prototyping and manufacturing of turn-key technological solutions. Using mechanical and electronic components to create the most advanced solutions, every item is designed and built accordingly with client's specifications.

In the area of Digital Signage, IMECON has developed a range of products with features that are unique to the market and which are supported by stringent tests performed at independent laboratories to guarantee safety and quality.

TOTAL SOLUTION PROVIDER

A perfect integration of precision mechanics, electronics components and advanced software makes possible for IMECON Engineering the realization of 100% custom products accordingly to user requirements. Choosing IMECON Engineering as your consultant provides you a highly qualified partner capable of managing all aspects related to complex project rollouts: an end-to-end approach that secure a reliable and cost effective go to market.

PROGRAM CAMALEONTE

The Camaleonte program was created to satisfy our most demanding day-to-day needs. We firmly believe that true exclusivity can only be attained through a meticulous selection of materials and careful attention to every detail, born out of a manufacturing process based on hard work.

Who is the Camaleonte program aimed at? The Camaleonte program is aimed at a demanding audience of people who are unwilling to settle and looking for a product that is one of a kind.

FACTORY

A brand new building with more than 5,000 m² dedicated to the manufacturing of all products designed by the R&D with a dust controlled environment and a strict quality control system ensure the highest standards in terms of reliability and quality to the outgoing products. Every single production step is executed internally: aluminium extrusions are tooled by two 5-axis work centers directly linked to the CAD stations for a perfect execution of the sophisticated processes; raw glass is tooled and laminated in a state-of-the-art plant to achieve the maximum flexibility and quality.

TECHNOLOGIES

Several years of experience have accrued a number of technologies that are now available to realize virtually any new project: specific patents have been deposited involving the innovations of backlight unit, of the nanoparticles treatment for the aluminium and of the telemetry system.
